Rules for DTT	18

DTT: the exchange rule

In Jacobs (10.1) the exchange rule for DTT is stated like this:

$$\frac{\Gamma, x : \sigma, y : \tau, \Delta \vdash M : \rho}{\Gamma, y : \tau, x : \sigma, \Delta \vdash M : \rho}$$

with a side-condition: “ x is not free in τ ”.

Let’s translate this:

$$\frac{\vec{a}:\vec{A}, b:B_{\vec{a}}, c:C_{\vec{a}}, \vec{d}:\vec{D}_{\vec{a}bc} \vdash e_{\vec{a}bcd}:E_{\vec{a}bcd}}{\vec{a}:\vec{A}, c:C_{\vec{a}}, b:B_{\vec{a}}, \vec{d}:\vec{D}_{\vec{a}bc} \vdash e_{\vec{a}bcd}:E_{\vec{a}bcd}}$$

Note that if we had used $c : C_{\vec{a}b}$ instead of $c : C_{\vec{a}}$ the bottom judgment would have made no sense.

Let’s make this shorter.

We can hide the annotations that indicate dependencies, the types, and the “vector” marks:

$$\frac{\vec{a}:\vec{A}, b:B, c:C, \vec{d}:\vec{D} \vdash e:E}{\vec{a}:\vec{A}, c:C, b:B, \vec{d}:\vec{D} \vdash e:E} \quad \frac{\vec{a}, b, c, \vec{d} \vdash e}{\vec{a}, c, b, \vec{d} \vdash e} \quad \frac{a, b, c, d \vdash e}{a, c, b, d \vdash e}$$

It is this last form that we will use.

Exercise: rewrite the first translation with

$$\begin{aligned} (\vec{a}:\vec{A}) &:= (a_1:A_1[], \dots, a_n:A_n[a_1, \dots, a_{n-1}]) \\ (\vec{d}:\vec{D}_{\vec{a}bc}) &:= (d_1:D_1[a_1, \dots, a_n, b, c], \dots, \\ &\quad d_m:D_m[a_1, \dots, a_n, b, c, d_1, \dots, d_{m-1}]) \end{aligned}$$

and check that the rule becomes unbearably big.

DTT: the “unpack” rule

In Jacobs (10.1, but after 10.1.2) the strong sum-elimination rule is stated as this:

$$\frac{\Gamma, z : \Sigma x : \sigma. \tau \vdash \rho : \mathbf{Type} \quad \Gamma, x : \sigma, y : \tau \vdash Q : \rho[\langle x, y \rangle / z]}{\Gamma, z : \Sigma x : \sigma. \tau \vdash (\text{unpack } z \text{ as } \langle x, y \rangle \text{ in } Q) : \rho} \text{ (strong)}$$

In an “unpack” term like

$$\text{unpack } P \text{ as } \langle x, y \rangle \text{ in } Q$$

the “unpack” binds two variables in Q , x and y , at the same time, and sets their values to the components of the (dependent) pair P .

In the presence of π and π' we can *define*:

$$(\text{unpack } P \text{ as } \langle x, y \rangle \text{ in } Q) := Q[x := \pi P, y := \pi' P].$$

Let’s change the “unpack” notation one step at a time:

$$\begin{aligned} & \text{unpack } P \text{ as } \langle x, y \rangle \text{ in } Q \\ \Rightarrow & \text{unpack } P =: x, y \text{ in } Q \\ \Rightarrow & Q[x, y := P] \end{aligned}$$

Now let’s rewrite the rule:

$$\frac{\Gamma, z : \Sigma x : \sigma. \tau \vdash \rho : \mathbf{Type} \quad \Gamma, x : \sigma, y : \tau \vdash Q : \rho[z := \langle x, y \rangle]}{\Gamma, z : \Sigma x : \sigma. \tau \vdash Q[x, y := z] : \rho}$$

$$\frac{\vec{a} : \vec{A}, p : (\Sigma b : B. C) \vdash D : \mathbf{Type} \quad \vec{a} : \vec{A}, b : B, c : C \vdash d : D[p := \langle b, c \rangle]}{\vec{a} : \vec{A}, p : (\Sigma b : B. C) \vdash d[b, c := p] : D}$$

$$\frac{\vec{a} : \vec{A}, (b, c) : (\Sigma b : B. C) \vdash D : \mathbf{Type} \quad \vec{a} : \vec{A}, b : B, c : C \vdash d : D[(b, c) := \langle b, c \rangle]}{\vec{a} : \vec{A}, (b, c) : (\Sigma b : B. C) \vdash d[b, c := (b, c)] : D}$$

$$\frac{\vec{a}, (b, c) \vdash D \quad \vec{a}, b, c \vdash d}{\vec{a}, (b, c) \vdash d[b, c := (b, c)]}$$

$$\frac{a, (b, c) \vdash D \quad a, b, c \vdash d}{a, (b, c) \vdash d[b, c := (b, c)]} \Sigma E^+$$

$$\frac{a, (b, c) \vdash D \quad a, b, c \vdash d}{a, (b, c) \vdash d} \Sigma E^+$$

We will use the two last forms.

DTT: structural rules

These ones are used very often:

$$\begin{array}{l} \text{Variable:} \quad \frac{a \vdash B}{a, b \vdash b} \text{ v} \\ \\ \text{Substitution:} \quad \frac{a \vdash b \quad a, b, c \vdash D}{a, c \vdash D} \text{ s} \quad \frac{a \vdash b \quad a, b, c \vdash d}{a, c \vdash d} \text{ s} \\ \\ \text{Weakeking:} \quad \frac{a \vdash B \quad a \vdash C}{a, b \vdash C} \text{ w} \quad \frac{a \vdash B \quad a \vdash c}{a, b \vdash c} \text{ w} \end{array}$$

These ones not so much:

$$\begin{array}{l} \text{Conversion:} \quad \frac{a \vdash b \quad a \vdash B = B'}{a \vdash b'} \text{ conv} \\ \\ \text{Contraction:} \quad \frac{a, b, b', c \vdash D}{a, b, c \vdash D} \text{ contr} \quad \frac{a, b, b', c \vdash d}{a, b, c \vdash d} \text{ contr} \\ \\ \text{Exchange:} \quad \frac{a, b, c, d \vdash E}{a, c, b, d \vdash E} \text{ exch} \quad \frac{a, b, c, d \vdash e}{a, c, b, d \vdash e} \text{ exch} \end{array}$$

Note: “Variable” is called “Projection” at [Jacobs].

DTT: type rules

We have four different type-formers:

singleton, (dependent) products, (dependent) sums, and equality.

For each one of them we have a type-building rule, an introduction rule, and elimination rules.

There are several options for elimination rules for dependent sums and equality.

In a system with “weak sums” the rule is ΣE^- .

In a system with “strong sums” the rule is ΣE^+ , or, equivalently, $\pi + \pi'$.

In a system with “weak equality” the rule is $\text{Eq}E^-$.

In a system with “strong equality” the rule is $\text{Eq}E^+$, or, equivalently, $\text{ee} + \text{ur}$ (“externalization of equality” plus “uniqueness of reflexivity”).

Singleton:	$\frac{}{\vdash 1} \text{1}$	$\frac{}{\vdash *} \text{1I}$	$\frac{a \vdash *'}{a \vdash *' = *} \text{1E}$
Products:	$\frac{a, b \vdash C}{a \vdash \Pi b : B.C} \text{II}$	$\frac{a, b \vdash c}{a \vdash b \mapsto c} \text{III}$	$\frac{a \vdash b \quad a \vdash b \mapsto c}{a \vdash c} \text{IIIE}$
Sums:	$\frac{a, b \vdash C}{a \vdash \Sigma b : B.C} \Sigma$	$\frac{a \vdash B \quad a, b \vdash C}{a, b, c \vdash (b, c)} \Sigma\text{I}$	(See below)
Equality:	$\frac{a \vdash B}{a, b, b' \vdash W[b = b']} \text{Eq}$	$\frac{a \vdash B}{a, b \vdash (b = b)} \text{EqI}$	(See below)
	$\frac{a \vdash D \quad a, b, c \vdash d}{a, (b, c) \vdash d} \Sigma E^-$	$\frac{a, b, b', c \vdash D \quad a, b, c \vdash d}{a, b, b', (b = b'), c \vdash d} \text{Eq}E^-$	
	$\frac{a, (b, c) \vdash D \quad a, b, c \vdash d}{a, (b, c) \vdash d} \Sigma E^+$	$\frac{a, b, b', (b = b') \vdash C \quad a, b \vdash c}{a, b, b', (b = b') \vdash c} \text{Eq}E^+$	
	$\frac{a \vdash b, c}{a \vdash b} \pi$	$\frac{a \vdash b, c}{a \vdash c} \pi'$	$\frac{a \vdash (b = b')}{a \vdash b = b'} \text{ee} \quad \frac{a \vdash (b = b)'}{a \vdash (b = b)' = (b = b)} \text{ur}$

DTT: alternate rules for strong sum

Jacobs, 10.1.3 (i):

The rules π and π' can be defined from ΣE^+ :

$$\frac{a \vdash (b, c)}{a \vdash b} \pi \quad := \quad \frac{a \vdash (b, c)}{a \vdash b} \frac{\frac{\frac{a, b \vdash C}{a \vdash \Sigma b.C} \Sigma \quad a \vdash B}{a, (b, c) \vdash B} w \quad \frac{\frac{a \vdash B}{a, b \vdash b} v}{a, b, c \vdash b} w}{a, (b, c) \vdash b} \Sigma E^+}{a \vdash b} s$$

$$\frac{a \vdash (b, c)}{a \vdash c} \pi' \quad := \quad \frac{a \vdash (b, c)}{a \vdash c} \frac{\frac{\frac{a, b \vdash C}{a, (b, c) \vdash b} s \quad \frac{a, b \vdash C}{a, b, c \vdash c} v}{a, (b, c) \vdash C} \Sigma E^+}{a, (b, c) \vdash c} s$$

The rule ΣE^+ can be defined from π and π' :

$$\frac{a, (b, c) \vdash D \quad a, b, c \vdash d}{a, (b, c) \vdash d} \Sigma E^+$$

$$:= \frac{\frac{a, b \vdash C}{a, (b, c) \vdash c} \pi' \quad \frac{\frac{\frac{a, b \vdash C}{a, (b, c) \vdash b} \pi \quad \frac{\frac{a, b \vdash C}{a \vdash \Sigma b.C} \Sigma \quad a, b, c \vdash d}{a, (b, c), b, c \vdash d} w}{a, (b, c), c \vdash d} s}}{a, (b, c) \vdash d} s$$

DTT: Alternate rules for strong equality

The ΣE^+ rule is equivalent to the two rules ee and ur , that say that from “witnesses of equality” we can prove external equality - i.e., that some terms are equal. This equivalence $\Sigma E^+ \iff (ee, ur)$ is of a different nature from the ones that we have seen before - this one uses $\beta/\epsilon/:=$ and lives intrinsically in the (P+T) structure - it cannot be restricted to the T-part (i.e., to the syntactical world).

$$\begin{array}{l}
 a, b, b', e \vdash b \\
 \underline{\eta} \\
 b[b' := b, e := r] \text{ with } b = b' \text{ via } e \\
 = \\
 b'[b' := b, e := r] \text{ with } b = b' \text{ via } e \\
 \underline{\eta} \\
 b'
 \end{array}$$

$$\begin{array}{l}
 a, b, b', e \vdash e \\
 \underline{\eta} \\
 e[b' := b, e := r] \text{ with } b = b' \text{ via } e \\
 = \\
 r[b' := b, e := r] \text{ with } b = b' \text{ via } e \\
 \underline{\eta} \\
 r
 \end{array}$$

Adjunction diagrams

$$\begin{array}{ccc}
 \begin{array}{c}
 \begin{array}{ccc}
 \begin{array}{c} (c) \\ (a, b) \end{array} & \xrightleftharpoons{\text{co}\square} & \begin{array}{c} (b=b'), c \\ (a, b, b') \end{array} \\
 \downarrow \begin{array}{l} a, b; c \vdash d \\ a, b; c \vdash d[b' := b, e := r] \end{array} & \begin{array}{c} \rightleftarrows \\ \square \\ \rightleftarrows \end{array} & \downarrow \begin{array}{l} a, b, b'; e, c \vdash d[b = b' \text{ via } e] \\ a, b, b'; e, c \vdash d \end{array} \\
 \begin{array}{c} (d) \\ (a, b) \end{array} & \xrightleftharpoons{\square} & \begin{array}{c} (d) \\ (a, b, b') \end{array}
 \end{array} \\
 a, b \vdash \longrightarrow a, b, b'
 \end{array}
 \qquad
 \begin{array}{ccc}
 \begin{array}{c}
 \begin{array}{ccc}
 \begin{array}{c} (c) \\ (a, b) \end{array} & \xrightleftharpoons{\text{co}\square} & \begin{array}{c} (b, c) \\ (a) \end{array} \\
 \downarrow \begin{array}{l} a, b; c \vdash d \\ a, b; c \vdash d[p := \langle b, c \rangle] \end{array} & \begin{array}{c} \rightleftarrows \\ \square \\ \rightleftarrows \end{array} & \downarrow \begin{array}{l} a; p \vdash d[b, c := p] \\ a; p \vdash d \end{array} \\
 \begin{array}{c} (d) \\ (a, b) \end{array} & \xrightleftharpoons{\square} & \begin{array}{c} (d) \\ (a) \end{array} \\
 \downarrow \begin{array}{l} a, b; d \vdash fb \\ a, b; d \vdash e \end{array} & \begin{array}{c} \rightleftarrows \\ \square \\ \rightleftarrows \end{array} & \downarrow \begin{array}{l} a; d \vdash f \\ a; d \vdash \lambda b. e \end{array} \\
 \begin{array}{c} (e) \\ (a, b) \end{array} & \xrightarrow{\quad} & \begin{array}{c} (b \rightarrow e) \\ (a) \end{array} \\
 a, b \vdash \longrightarrow a
 \end{array}
 \end{array}$$

$$\begin{array}{ccc}
 \begin{array}{c}
 \begin{array}{ccc}
 \begin{array}{c} (c) \\ (a, b) \end{array} & \xrightleftharpoons{\text{co}\square} & \begin{array}{c} (b, c) \\ (a) \end{array} \\
 \downarrow \begin{array}{l} a, b; c \vdash d \\ a, b; c \vdash d[b, c := p][p := \langle b, c \rangle] \end{array} & \begin{array}{c} \rightleftarrows \\ \square \\ \rightleftarrows \end{array} & \downarrow \begin{array}{l} a; p \vdash d[b, c := p] \\ a; p \vdash d[b, c := p] \end{array} \\
 \begin{array}{c} (d) \\ (a, b) \end{array} & \xrightleftharpoons{\square} & \begin{array}{c} (d) \\ (a) \end{array}
 \end{array}
 \end{array}$$

$$\begin{array}{ccc}
 \begin{array}{c}
 \begin{array}{ccc}
 \begin{array}{c} (c) \\ (a, b) \end{array} & \xrightleftharpoons{\text{co}\square} & \begin{array}{c} (b, c) \\ (a) \end{array} \\
 \downarrow \begin{array}{l} a, b; c \vdash d[p := \langle b, c \rangle] \\ a, b; c \vdash d[p := \langle b, c \rangle] \end{array} & \begin{array}{c} \rightleftarrows \\ \square \\ \rightleftarrows \end{array} & \downarrow \begin{array}{l} a; p \vdash d[p := \langle b, c \rangle][b, c := p] \\ a; p \vdash d \end{array} \\
 \begin{array}{c} (d) \\ (a, b) \end{array} & \xrightleftharpoons{\square} & \begin{array}{c} (d) \\ (a) \end{array}
 \end{array}
 \end{array}$$

Conversions

Conventions:

β -conversions first, then η -conversions.

Underlined names are terms.

math>

$\underline{(b=b)}$ is the reflexivity term.

$$\begin{aligned}
 (\lambda b. \underline{c}) \underline{b} &= \underline{c}[b := b] \\
 \lambda b. \underline{f} b &= \underline{f} \\
 \text{unpack } \langle \underline{b}, \underline{c} \rangle \text{ as } \langle b, c \rangle \text{ in } \underline{d} &= \underline{d}[b := b, c := c] \\
 \text{unpack } \underline{(b, c)} \text{ as } \langle b, c \rangle \text{ in } \underline{d}[\langle b, c \rangle := (b, c)] &= \underline{d}[\underline{(b, c)} := (b, c)] \\
 \underline{d} \text{ with } b = b \text{ via } \underline{(b=b)} &= \underline{d} \\
 \underline{d}[b := b', \underline{(b=b)} := (b=b)'] \text{ with } b' = b \text{ via } \underline{(b=b)'} &= \underline{d}
 \end{aligned}$$

$$\begin{aligned}
 a \vdash f &\stackrel{\beta}{=} \lambda b. fb \\
 a, b \vdash e &\stackrel{\eta}{=} (\lambda b. e)b \\
 a, b, c \vdash d &= d[b, c := \langle b, c \rangle] \\
 a, p \vdash d &= d[p := \langle b, c \rangle][b, c := p] \\
 a, b, c \vdash d &= d[\text{with } b = b \text{ via } r] \\
 a, b, b', e, c \vdash d &= d[b' := b, e := r][\text{with } b' = b \text{ via } e]
 \end{aligned}$$

$$\frac{\Gamma, x : \sigma, x' : \sigma, \Delta \vdash \rho : \text{Type} \quad \Gamma, x : \sigma, \Delta[x/x'] \vdash Q : \rho[x/x']}{\Gamma, x : \sigma, x' : \sigma, z : \text{Eq}_\sigma(x, x'), \Delta \vdash (Q \text{ with } x' = x \text{ via } z) : \rho} \text{ (weak)}$$

$$\frac{a, b, b', c \vdash D \quad a, b, c[b = b'] \vdash d : D[b = b']}{a, b, b', (b = b'), c \vdash (d \text{ with } b' = b \text{ via } (b = b')) : D} \text{ (weak)}$$

Comprehension categories with unit

Jacobs, 10.4.7 (p.616):

A fibration $p : \mathbb{E} \rightarrow \mathbb{B}$ with a terminal object functor $1 : \mathbb{B} \rightarrow \mathbb{E}$ (where we know by lemma 1.8.8 that $p \dashv 1$ and that $\eta_I = \text{id}$) is *comprehension category with unit* if 1 has a right adjoint. We call this right adjoint $\{-\}$.

$$\begin{array}{ccccc}
 \begin{pmatrix} b \\ a \end{pmatrix} & \dashv\vdash & \begin{pmatrix} * \\ c \end{pmatrix} & \dashv\vdash & \begin{pmatrix} e \\ d \end{pmatrix} \\
 \parallel p & & \uparrow 1 & & \parallel \{-\} \\
 a & \dashv\vdash & c & \dashv\vdash & d, e
 \end{array}$$

Jacobs, 10.4.7 (p.616):

Definition of the functor $\mathbb{E} \rightarrow \mathbb{B}^\rightarrow$:

its action on objects is $X \mapsto p \varepsilon_X$.

$$\begin{array}{ccc}
 1\{X\} & \xrightarrow{\varepsilon_X} & X \\
 \uparrow & & \uparrow \\
 \{X\} & \xrightarrow{\text{id}} \{X\} & \xrightarrow{p\varepsilon_X} pX
 \end{array}
 \qquad
 \begin{array}{ccc}
 \begin{pmatrix} * \\ d, e \end{pmatrix} & \dashv\vdash & \begin{pmatrix} e \\ d \end{pmatrix} \\
 \uparrow & & \uparrow \\
 d, e & \dashv\vdash & d, e \dashv\vdash d
 \end{array}$$

The functor $\mathbb{E} \rightarrow \mathbb{B}^\rightarrow$ is a comprehension category, i.e., it takes cartesian morphisms to pullback squares.

We want to check that the image of a cartesian morphism is a pullback.

Given two maps $i \mapsto a$ and $i \mapsto c, d$ such that $a \mapsto c$ is well-defined, we need to construct a mediating map $i \mapsto a, b$.

Comprehension categories with unit: a bijection

Jacobs, 10.4.9 (i):

In a CCw1, pack a morphism $u : I \rightarrow J$ in the base category, and an object Y over J . Then the vertical morphisms $1I \rightarrow u^*Y$ are in bijection with morphisms from u to π_Y in \mathbb{B}/J .

Comprehension categories with unit: big bijection

Jacobs, 10.4.9 (ii):

$a, c; b \vdash d$
 $a; b \vdash c \rightarrow d$

Comprehension categories with unit: three rules

Jacobs, 10.3.3:

The categorical interpretation of
the rules for dependent sums:

$$\frac{a, b \vdash C}{a; b, c \vdash (b, c)} \Sigma I$$

$$\frac{a, (b, c) \vdash D \quad a, b, c \vdash d}{a, (b, c) \vdash d} \Sigma E^+$$

$$\frac{a \vdash D \quad a, b, c \vdash d}{a, (b, c) \vdash d} \Sigma E^-$$

(Oops, the diagram for ΣE^- is wrong)

Interpreting Π and ΠE in a CCompC
(Jacobs, 10.5.3)

$$\begin{array}{ccc}
 1\{X\} \longleftarrow 1I & & \begin{pmatrix} * \\ a, b \end{pmatrix} \longleftarrow \begin{pmatrix} * \\ a \end{pmatrix} \\
 f \downarrow \quad \longrightarrow \quad \downarrow \lambda_X f & & a, b \vdash c \downarrow \quad \longmapsto \quad \downarrow a \vdash (b \rightarrow c) \\
 Y \longmapsto \Pi_X Y & & \begin{pmatrix} c \\ a, b \end{pmatrix} \Rightarrow \begin{pmatrix} b \rightarrow c \\ a \end{pmatrix}
 \end{array}$$

$$\begin{array}{ccc}
 & & X \\
 & \swarrow & \downarrow \\
 \{X\} & \xrightarrow{\pi_X} & I
 \end{array}
 \qquad
 \begin{array}{ccc}
 & & \begin{pmatrix} b \\ a \end{pmatrix} \\
 & \swarrow & \downarrow \\
 a, b \vdash & \longrightarrow & a
 \end{array}$$

$$\begin{array}{ccccc}
 1I \longleftarrow \pi_X^* 1I \longleftarrow 1I & & \begin{pmatrix} * \\ a \end{pmatrix} \longleftarrow \begin{pmatrix} * \\ a, b \end{pmatrix} \longleftarrow \begin{pmatrix} * \\ a \end{pmatrix} \\
 gh \downarrow \quad \longleftarrow \quad g \downarrow \quad \longleftarrow \quad \downarrow g & & a \vdash c \downarrow \quad \longleftarrow \quad \downarrow \quad \longleftarrow \quad \downarrow a \vdash (b \rightarrow c) \\
 h^{\vee*} Y \longleftarrow Y \longmapsto \Pi_X Y & & \begin{pmatrix} c \\ a \end{pmatrix} \longleftarrow \begin{pmatrix} c \\ a, b \end{pmatrix} \Rightarrow \begin{pmatrix} b \rightarrow c \\ a \end{pmatrix}
 \end{array}$$

$$\begin{array}{ccc}
 1I \xrightarrow{h} X & & \begin{pmatrix} * \\ a \end{pmatrix} \xrightarrow{a \vdash b} \begin{pmatrix} b \\ a \end{pmatrix} \\
 \uparrow \quad \downarrow & \swarrow & \uparrow \quad \downarrow \\
 I \xrightarrow{h^\vee} \{X\} \xrightarrow{\pi_X} I & & a \xrightarrow{c} a, b \vdash \longrightarrow a
 \end{array}$$

In the top left vertex of the diagram for ΠE we have omitted an iso to keep the diagram shorter: $1I \cong h^{\vee*} \pi_X^* 1I$.

Interpreting ΣI in a CCompC
 (Jacobs, 10.5.3)

$$\begin{array}{ccc}
 \begin{array}{c}
 \langle f, g \rangle \downarrow \\
 \begin{array}{ccccc}
 & 1I & & & \\
 & \downarrow g & & & \\
 f^{\vee*} X & \longleftarrow Y & \longrightarrow & \Sigma_X Y & \\
 \downarrow & & \longleftarrow & \downarrow & \longleftarrow \text{id} \\
 \Sigma_X Y & \longleftarrow \pi_X^* \Sigma_X Y & \longleftarrow & \Sigma_X Y &
 \end{array}
 \end{array}
 &
 \begin{array}{c}
 (*) \\
 \begin{array}{c}
 \begin{array}{ccc}
 \begin{array}{c} (a) \\ \downarrow a \vdash c \end{array} & & \\
 \begin{array}{ccc}
 \begin{array}{c} (c) \\ (a) \end{array} & \longleftarrow & \begin{array}{c} (c) \\ (a, b) \end{array} & \Longrightarrow & \begin{array}{c} (b, c) \\ (a) \end{array} \\
 \downarrow & \longleftarrow & \downarrow & \longleftarrow & \downarrow \\
 \begin{array}{c} (b, c) \\ (a) \end{array} & \longleftarrow & \begin{array}{c} (b, c) \\ (a, b) \end{array} & \longleftarrow & \begin{array}{c} (b, c) \\ (a) \end{array}
 \end{array}
 \end{array}
 \end{array}
 \end{array}
 \end{array}
 \end{array}
 \end{array}$$

$$\begin{array}{ccc}
 \begin{array}{ccc}
 1I & \xrightarrow{f} & X \\
 \uparrow & \downarrow & \swarrow \\
 I & \xrightarrow{f^{\vee}} \{X\} \xrightarrow{\pi_X} & I
 \end{array}
 &
 \begin{array}{ccc}
 (*) & \xrightarrow{a \vdash b} & (b) \\
 \uparrow & \downarrow & \swarrow \\
 a & \xrightarrow{\subset} a, b \xrightarrow{\vdash} & a
 \end{array}
 \end{array}$$

Interpreting ΣE^+ in a CCompC
(Jacobs, 10.5.3)

The “unpack” rule (2)

In 10.1.2 Jacobs defines (for $P : \sigma \times \tau$):

$$\pi P \stackrel{\text{def}}{=} \text{unpack } P \text{ as } \langle x, y \rangle \text{ in } x$$

$$\pi' P \stackrel{\text{def}}{=} \text{unpack } P \text{ as } \langle x, y \rangle \text{ in } y$$

i.e.,

$$\pi P := x[x, y := P]$$

$$\pi' P := y[x, y := P]$$

Rules for DTT

Conversion:	$\frac{a -b \quad a -B=B'}{\text{-----}} \\ a -b'$		
Projection:	$\frac{a -B}{\text{-----}} \\ a,b -b$		
Contraction:	$\frac{a,b,b',c -D}{\text{-----}} \\ a,b,c -D$	$\frac{a,b,b',c -d}{\text{-----}} \\ a,b,c -d$	
Substitution:	$\frac{a -b \quad a,b,c -D}{\text{-----}} \\ a,c -D$	$\frac{a -b \quad a,b,c -d}{\text{-----}} \\ a,c -d$	
Weakening:	$\frac{a -B \quad a -C}{\text{-----}} \\ a,b -C$	$\frac{a -B \quad a -c}{\text{-----}} \\ a,b -c$	
Exchange:	$\frac{a,b,c,d -E}{\text{-----}} \\ a,c,b,d -E$	$\frac{a,b,c,d -e}{\text{-----}} \\ a,c,b,d -e$	
	Type:	Intro:	Elim:
Singleton:	$\frac{\text{---}}{ -1}$	$\frac{\text{---}}{ -*}$	$\frac{a -*'}{\text{-----}} \\ a -*'=*$
DepProds:	$\frac{a,b -C}{\text{-----}} \\ a -\prod b:B.C$	$\frac{a,b -c}{\text{-----}} \\ a -b ->c$	$\frac{a -b \quad a -b ->c}{\text{-----}} \\ a -c$
DepSums:	$\frac{a,b -C}{\text{-----}} \\ a -\sum b:B.C$	$\frac{a -B \quad a,b -C}{\text{-----}} \\ a,b,c -(b,c)$	(see below)
Equality:	$\frac{a -B}{\text{-----}} \\ a,b,b' -W[b=b']$	$\frac{a -B}{\text{-----}} \\ a,b -(b=b)$	(see below)
Elimination rules:			
	DepSums:	Equality:	
Weak:	$\frac{a -D \quad a,b,c -d}{\text{-----}} \\ a,(b,c) -d$	$\frac{a,b,b',c -D \quad a,b,c -d}{\text{-----}} \\ a,b,b',(b=b'),c -d$	
Strong:	$\frac{a,(b,c) -D \quad a,b,c -d}{\text{-----}} \\ a,(b,c) -d$	$\frac{a,b,b',(b=b') -C \quad a,b -c}{\text{-----}} \\ a,b,b',(b=b') -c$	
AltStrong:	$\frac{a -b,c}{\text{-----}} \\ a -b$	$\frac{a -b,c}{\text{-----}} \\ a -c$	$\frac{a -(b=b')}{\text{-----}} \\ a -b=b'$
			$\frac{a -(b=b)'}{\text{-----}} \\ a -(b=b)'=(b=b)$
